UDDEHOLM

# General

Orvar 2 Microdized is a chromium-molybdenum-vanadium-alloyed steel which is characterized by:

- Good resistance to abrasion at both low and high temperatures
- High level of toughness and ductility
- Uniform and high level of machinability and polishability
- Good high-temperature strength and resistance to thermal fatigue
- Excellent through-hardening properties
- Very limited distortion during hardening.

# Heat treatment

### SOFT ANNEALING

Protect the steel and heat through to 850°C (1560°F). Then cool in the furnace at 10°C (20°F) per hour to 650°C (1200°F), then freely in air.

### STRESS RELIEVING

After rough machining the tool should be heated through to 650°C (1200°F), holding time 2 hours. Cool slowly to 500°C ( 930°F), then freely in air.

### HARDENING

*Pre-heating temperature:* 600–850°C (1110–1560°F), normally in two pre-heating steps.

*Austenitizing temperature:* 1020–1050°C (1870–1920°F), normally 1020–1030°C (1870–1885°F).

| Temperature °C | Temperature °F | Soaking* time minutes | Hardness before tempering |
|---|---|---|---|
| 1025 | 1875 | 30 | 53±2 HRC |
| 1050 | 1920 | 15 | 54±2 HRC |

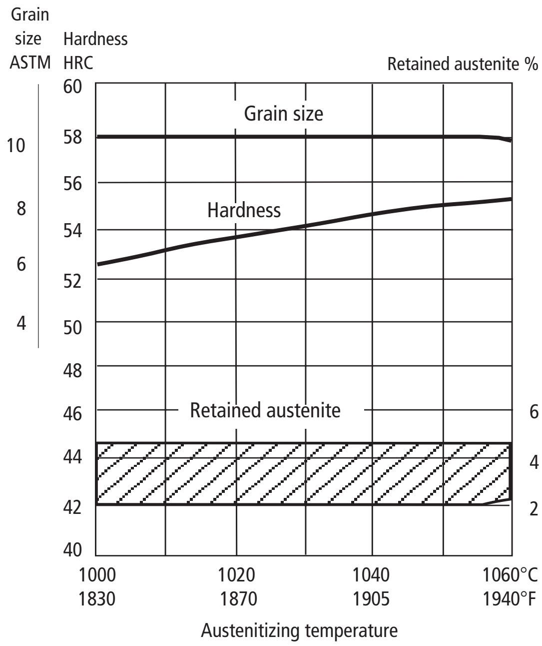
**QUENCHING MEDIA**

- High speed gas/circulating atmosphere
- Vacuum (high speed gas with sufficient positive pressure). An interrupted quench is recommended where distortion control and quench cracking are a concern
- Martempering bath or fluidized bed at 450–550°C (840–1020°F), then cool in air
- Martempering bath or fluidized bed at approx. 180–220°C (360–430°F) then cool in air
- Warm oil.

*Note 1:* Temper the tool as soon as its temperature reaches 50–70°C (120–160°F).

*Note 2:* In order to obtain the optimum properties for the tool, the cooling rate should be fast, but not at a level that gives excessive distortion or cracks.

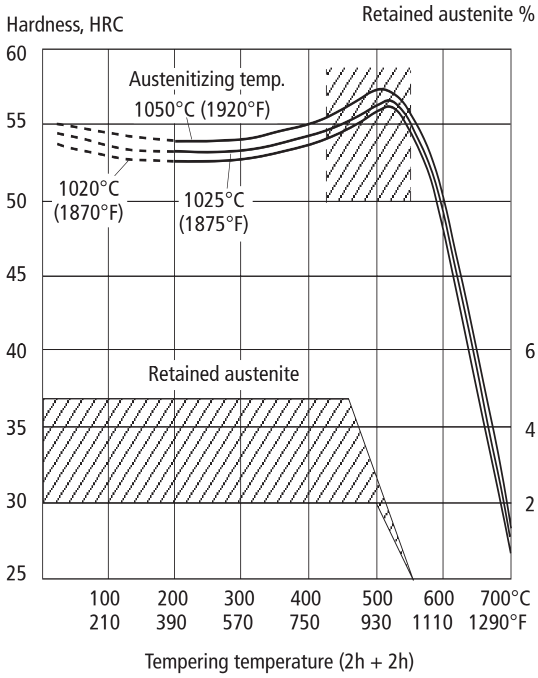
*Hardness, grain size and retained austenite as functions of austenitizing temperature*



## TEMPERING

Choose the tempering temperature according to the hardness required by reference to the tempering graph. Temper twice with intermediate cooling to room temperature. Lowest tempering temperature 180°C (360°F). Holding time at temperature minimum 2 hours. Do not temper in the range 425–550°C (800–1020°F).

*Tempering graph*



Tempering within the range 425–550°C (800–1020°F) is not normally recommended due to the reduction in toughness properties.

*Effect of time at tempering temperature*

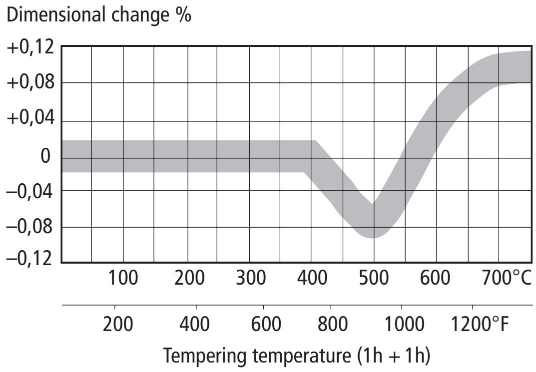
## DIMENSIONAL CHANGES DURING TEMPERING



*Note:* The dimensional changes in hardening and tempering should be added.

## NITRIDING AND NITROCARBURIZING

Nitriding and nitrocarburizing result in a hard surface layer which is very resistant to wear and erosion. The nitrided layer is, however, brittle and may crack or spall when exposed to mechanical or thermal shock, the risk increasing with layer thickness. Before nitriding, the tool should be hardened and tempered at a temperature at least 25–50°C (45–90°F) above the nitriding temperature.

Nitriding in ammonia gas at 510°C (950°F) or plasma nitriding in a 75% hydrogen/25% nitrogen mixture at 480°C (895°F) both result in a surface hardness of about 1100 $HV_{0,2}$. In general, plasma nitriding is the preferred method because of better control over nitrogen potential; in particular, formation of the so-called white layer, which is not recommended for hot-work service, can readily be avoided. However, careful gas nitriding can give perfectly acceptable results.

Orvar 2 Microdized can also be nitrocarburized in either gas or salt bath. The surface hardness after nitrocarburizing is 900–1000 $HV_{0,2}$.

### DEPTH OF NITRIDING

| Process | Time | Depth mm | Depth inch |
|---|---|---|---|
| Gas nitriding at 510°C (950°F) | 10 h<br>30 h | 0,12<br>0,20 | 0,0047<br>0,0079 |
| Plasma nitriding at 480°C (895°F) | 10 h<br>30 h | 0,12<br>0,18 | 0,0047<br>0,0071 |
| Nitrocarburizing – in gas at 580°C (1075°F) | 2,5 h | 0,11 | 0,0043 |
| – in salt bath at 580°C (1075°F) | 1 h | 0,06 | 0,0024 |

Nitriding to case depths >0,3 mm (0,012 inch) is not recommended for hot-work applications.

Orvar 2 Microdized can be nitrided in the soft-annealed condition. The hardness and depth of case will, however, be reduced somewhat in this case.

**GRINDING**

A general grinding wheel recommendation is given below. More information can be found in the Uddeholm brochure "Grinding of Tool Steel" and can also be obtained from the grinding wheel manufacturer.

**Wheel recommendation**

| Type of grinding | Soft annealed condition | Hardened condition |
|---|---|---|
| Face grinding straight wheel | A 46 HV | A 46 HV |
| Face grinding segments | A 24 GV | A 36 GV |
| Cylindrical grinding | A 46 LV | A 60 KV |
| Internal grinding | A 46 JV | A 60 IV |
| Profile grinding | A 100 LV | A 120 KV |

# Electrical-discharge machining

If spark-erosion is performed in the hardened and tempered condition, the white re-cast layer should be removed mechanically e.g. by grinding or stoning. The tool should then be given an additional temper at approx. 25°C (50°F ) below the previous tempering temperature.

# Welding

Welding of tool steel can be performed with good results if proper precautions are taken regarding elevated temperature, joint preparation, choice of consumables and welding procedure.

| **Welding method** | TIG | MMA |
|---|---|---|
| Working temperature | 325–375°C<br>620–710°F | 325–375°C<br>620–710°F |

| Cooling rate | 20–40°C/h (35–70°F/h) the first 2–3 h then freely in air. | |
| Hardness after welding | 50–55 HRC | 50–55 HRC |
| **Heat treatment after welding** | | |
| Hardened condition | Temper at 25°C (45°F) below the original tempering temperature. | |
| Soft annealed condition | Soft-anneal the material at 850°C (1560°F) in protected atmosphere. Then cool in the furnace at 10°C (20°F) per hour to 650°C (1200°F) then freely in air. | |

More detailed information can be found in the Uddeholm brochure "Welding of Tool Steel".

# Hard-chromium plating

After plating, parts should be tempered at 180°C (360°F) for 4 hours within 4 hours of plating to avoid the risk of hydrogen embrittlement.

# Photo-etching

Orvar 2 Microdized is particularly suitable for texturing by the photo-etching method. Its high level of homogeneity and low sulphur content ensures accurate and consistent pattern reproduction.

# Polishing

Orvar 2 Microdized exhibits good polishability in the hardened and tempered condition. Polishing after grinding can be effected using aluminium oxide or diamond paste.

Typical procedure:

1. Rough grinding to 180–320 grain size using a wheel or stone.
2. Fine grinding with abrasive paper or powder down to 400–800 grain size.
3. Polish with diamond paste grade 15 (15μm grain size) using a polishing tool of soft wood or fibre.
4. Polish with diamond paste 8–6–3 (8–6–3μm grain size) using a polishing tool of soft wood or fibre.
5. When demands on surface finish are high, grade 1 (1μm grain size) diamond paste can be used for final polishing with a fibre polishing pad.
